traditionally the ddss conferences aim to be a platform for both starting and experienced researchers who focus on the development and application of computer support in urban planning and architectural design this volume contains 31 peer reviewed papers from this year s conference this book will bring researchers together and is a valuable resource for their continuous joint effort to improve the design and planning of our environment

in order to ensure the criteria for monitoring and managing the various problems and design for decision control a mathematical description of exact human knowledge is required for the management of adaptive and complex systems decision control management and support in adaptive and complex systems quantitative models presents an application and demonstration of a new mathematical technique for descriptions of complex systems this comprehensive collection contains scientific results in the field of contemporary approaches to adaptive decision making that is essential for researchers scholars and students alike

the choice to include the human in the decision process affects four key areas of system design problem representation system analysis and design solution technique selection and interface requirements specification i introduce a design methodology that captures the necessary choices associated with each of these areas in particular i show how this methodology is applied to the design of an actual decision support system for satellite operations scheduling supporting the user s ability to monitor the actions of the system and to guide the decision process of the system are two key considerations in the successful design of a decision support system both of these points rely on the correct specification of human computer interaction points traditional computer centered system design approaches do not do this well if at all and are insufficient for the design of decision support systems these approaches typically leave the definition of human computer interaction points till after the component and system level designs are complete this is too late however since the component and system level design decisions can impose inflexible constraints on the choice of the human computer interaction points this often leads to the design of human computer interaction points that are only good enough these approaches result in ill conceived problem representations and poor user system interaction points because the system lacks the underlying architecture to support these constructs efficiently decision support systems require a new human centered design approach rather than the traditional computer centered approaches

master s thesis from the year 2017 in the subject computer sciences artificial intelligence grade 9 00 lovely professional university punjab lovely professional university punjab course m tech language english abstract residual life prediction is the technique which demonstrates how reliable a particular electronic system or component works under in specific operating conditions the remaining useful life relies on the failure rate of a

component and on the operating conditions of a device this failure rate drifts for the duration of the life of the item with time life is an important aspect while choosing the electronic hardware residual life estimation and life prediction are two distinct terms the importance of life estimation is to evaluate the remaining useful life of a specific component under the different stress parameters as an increasing number of components are integrated on to a chip the chances of failure increase as the different parts have their own stress factors and different working conditions so the condition monitoring strategies are utilized which enhances the reliability of a component and a suitable move to be made before any harmful breakdown happens the electronic circuits need a failure estimation technique to protect the system from unavoidable failures residual life estimation of electronic components is an important fact these days as electronic components and devices becomes a great need of society residual life prediction is predicting the remaining useful life of a component or device based on various failure factors of any component and it also depends on the operating conditions many methods for predicting the life of electronic components have been developed the life of electronic components can be predicted by creating an intelligent system for the failure analysis the capability to predict the life of electronic components is a key to prevent the sudden costly failure and it will increase the overall performance and reliability of a system so remaining useful life prediction is an important factor for every active and passive electronic component such as resistor capacitor and diode etc

this report presents partial findings from the dod cost factor project volume 1 r 4078 2 pa e describes the army decisionmaking process and this volume describes data sources and methods used to develop cost factors cost factors are measures used to estimate the cost implication of changes in defense missions force structures weapon systems or operating levels they include recurring operating and support costs

nonrecurring operations and maintenance costs and investments costs such as facility construction the study also examines intermediate factors such as personnel pay rates that are used to develop cost estimates

master s thesis from the year 2012 in the subject business economics business management corporate governance grade 1 7 heilbronn university language english abstract women are still significantly underrepresented in top management positions and leadership is still associated with the male gender as leadership theories traditionally focus on men this is especially evident in china which has one of the world s highest female labor participation but a female share of only eight percent on the corporate boards although chinese women s tertiary educational attainment is now equal to the tertiary education of chinese men they still face many barriers on their way to the top the strong influence of confucian values perceiving women as inferior to men remains noticeable until today and women find themselves exposed to a strongly patriarchal business environment as being traditionally the main care givers of their families they are deemed to be expensive potential mothers and thus gender preference can be observed second classical leadership theories of the western culture as well as of the chinese culture are introduced to provide a common understanding of their approaches further the situation of women in the past and of today is being compared as well as their leadership styles access to managerial leadership positions and the barriers they face since educational attainment of both genders does not explain why women are rarely found on the upper managerial ranks other reasons that could be a barrier for women s career advancement are examined in this research
